

METHOD AND APPARATUS FOR AUTOMATICALLY UPDATING A MOBILE WEB LOG (BLOG) TO REFLECT MOBILE TERMINAL ACTIVITY

ABSTRACT OF THE DISCLOSURE

A mobile terminal includes a memory storing application software and data that is descriptive of the use of the mobile terminal, a display and a controller that is coupled to the memory. The controller is responsive to the application software and to at least a sub-set of the stored data for visualizing on the display, in a graphical form, the use of the mobile station over a period of time. The controller preferably constructs a temporally-based visualization of the use of the mobile station, such as a timeline visualization of the use of the mobile station. The controller may further be responsive to the application software and to at least the sub-set of the stored data for automatically deriving a content of a user's web log (blog). A method is also disclosed to operate a mobile terminal having a memory storing application software and data that is descriptive of the use of the mobile terminal, and that further has a display and a controller coupled to the memory. The method includes selecting at least a portion of the data and constructing a blog that is indicative of the use of the mobile station over a period of time, as indicated by the selected portion of the data. The blog may include an animation that is indicative of the use of the mobile station over the period of time, and may also include textual data that is automatically generated in accordance with the use of the mobile station over the period of time.
